

DOES FLEXSCREEN FIT IN YOUR WINDOW FRAME?

The FlexScreen frame requires **at least 10 mm** of space to ensure that your window closes properly. You can check whether your window is equipped with sufficient space with this simple test.

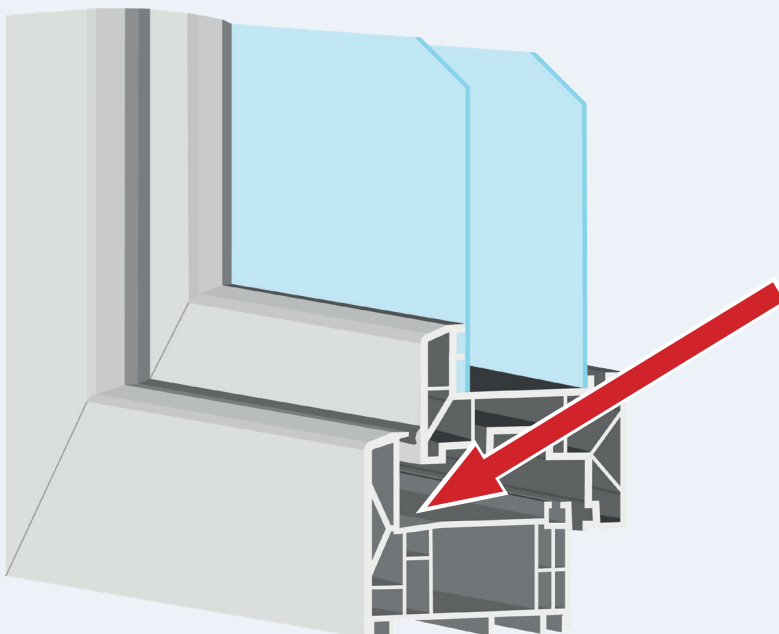

The pencil test:

You can easily test whether the FlexScreen frame fits into your window. Place a **pencil** in the window frame, as shown in the pictures.

If the pencil fits well into the frame and your window can be closed and reopened without any problems and open again without any problems, the FlexScreen frame will most likely also have enough space.

This space must be **available in the entire window frame**, not just where the pencil is inserted.

This is where the FlexScreen is placed.

The pencil should have enough space at this point to ensure that your insect screen fits well.
